(54) **FUROISOQUINOLINE DERIVATIVES, PROCESS FOR PRODUCING THE SAME AND USE THEREOF**

(57) A compound having a partial structure represented by Formula:

or a salt thereof has an excellent phosphodiesterase (PDE) IV-inhibiting effect, and is useful as a prophylactic or therapeutic agent against inflammatory diseases, for example, bronchial asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, autoimmune disease, diabetes and the like.

## Description

## TECHNICAL FIELD

5 [0001] The present invention relates to a novel furoisoquinoline derivative which has a phosphodiesterase (PDE) IV-inhibiting effect and which is useful as a prophylactic or therapeutic agent against the inflammatory diseases, for example, bronchial asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, autoimmune disease, diabetes and the like and process for producing the same and use thereof.

## 10 BACKGROUND ART

[0002] It is known in these days that a large number of hormones and neurotransmitters function to increase or decrease the intracellular level of cyclic adenosine-3',5'-monophosphate (cAMP) which is an intracellular second messenger, whereby regulating the cellular functions. The intracellular cAMP level is regulated by synthesizing and degrading enzymes. Thus, cAMP is produced by adenylyl cyclases and degraded by phosphodiesterase (PDE). These

15 degrading enzymes also regulate the degradation of cyclic guanosine-3',5'-monophosphate. [0003] Seven isozymes of the PDE have been found so far [Physiological Reviews, Vol.75, p725 (1995), Endocrine Reviews, Vol.16, p370, (1995)], and each functions, in various cells such as those in central nervous system, circulatory organs, respiratory organs, digestive organs, genital organs, blood cells and tracheal smooth muscles, to regulate intracellular cAMP and cGMP levels, whereby controlling the cellular functions. It is also known that in an inflammatory cell such as an eosinophile, neutrophile, monocyte, T-lymphocyte and macrophage a PDE isozyme referred to as PDE

20 type-IV exists predominantly [Clinical and Experimental Allergy, Vol.22, p337 (1992)]. [0004] Pharmaceuticals, which can broadly be classified into three groups, are employed as therapeutic agents against a bronchial asthma. Thus, the three types including bronchodilators (for example,  $\beta$ -adrenaline receptor agonists), antiinflammatory agents (for example, corticosteroids) and xanthine derivatives having both of the bronchodilating effect and antiinflammatory effect (for example, theophylline) are employed. Among these, theophylline has been employed as a therapeutic agent against asthma for a long time. Theophylline is becoming more interesting in these days since its bronchodilating effect has been found to be derived from a PDE-inhibiting effect. However, theophylline is a non-selective PDE inhibitor and sometimes exhibits a cardiovascular side effect. Then, its blood level should strictly

30 be controlled to reduce the side effect. Accordingly, a medicament for treating an inflammatory disease such as asthma which inhibits the PDE type-IV selectively and which has no effects on other isozymes of the PDE is desired. [0005] A study indicating a possibility that a PDE type-IV-selective inhibitor is an effective therapeutic agent against an inflammatory disease such as asthma was reported [Pulmonary Pharmacology, Vol.7, p1 (1994)]. Thus, it was suggested that a PDE type-IV-selective inhibitor has the both of an antiinflammatory effect and a bronchodilating effect and may exhibit a therapeutic effect on an inflammatory disease such as asthma. In fact, compounds having inhibitory effects selectively on the PDE type-IV are subjected currently to an extensive development all over the world. For

35 example, rolipram (JP-A-50-157360) having the structure represented by Formula:

50 and SB 207499 [The Journal of Pharmacology and Experimental Therapeutics, Vol.287, p988 (1998), Journal of Medicinal Chemistry, Vol.41, p821 (1998)] represented by Formula:

are under development. However, any of those listed above has not been employed clinically, and a further useful agent is desired to be developed.

[0006] On the other hand, a method for synthesizing a compound represented by Formula:

is disclosed in Indian Journal of Chemistry, Section B, Vol.31B, p578 (1992).

[0007] Moreover, an antibacterial compound represented by Formula:

is also disclosed in Indian Journal of Chemistry, Section B, Vol.33B, p552 (1994).

[0008] A potent selective PDE type-IV inhibitor having a novel chemical structure is expected to have a sufficient prophylactic or therapeutic effect in a wide range of diseases accompanied with inflammations, and is desired to be developed. The objective of the invention is to provide novel heterocyclic compounds which have selective PDE type-IV-inhibiting effect and increase the intracellular cAMP level whereby exhibiting bronchodilating and antiinflammatory effects and which is also excellent in terms of the safety.

# SUMMARY OF THE INVENTION

[0009] We made an effort and were finally successful for the first time in synthesizing a novel furoisoquinoline derivative (hereinafter abbreviated sometimes as Compound (I)) having a partial structure represented by Formula:

(wherein each of Ring A, Ring B and Ring C may have substituents, especially a novel furoisoquinoline derivative (hereinafter abbreviated sometimes as Compound (I')) whose significant chemical structural characteristics are the substituents introduced in the 1-, 2-, 3-, 4-, 5-, 6-, 8-, 9-positions etc. on the furoisoquinoline backbone, represented by Formula:

(wherein R<sup>1</sup> is a hydrogen atom, optionally substituted hydrocarbon group, optionally substituted heterocyclic group or optionally substituted amino group, each of R<sup>2</sup> and R<sup>3</sup> is a hydrogen atom, optionally substituted hydrocarbon group or acyl group, and R<sup>2</sup> and R<sup>3</sup> may be taken together with the adjacent carbon atom to form an optionally substituted 3- to 8-membered ring, R<sup>4</sup> is a hydrogen atom, cyano group, optionally substituted hydrocarbon group, acyl group or optionally substituted hydroxy group, R<sup>5</sup> is (1) a hydrogen atom, (2) an optionally substituted hydrocarbon group, (3) an acyl group, (4) an optionally substituted heterocyclic group or (5) a halogen atom, each of R<sup>6</sup> and R<sup>7</sup> is a hydrogen atom or optionally substituted hydrocarbon group, and R<sup>6</sup> and R<sup>7</sup> are taken together with the adjacent carbon atom to form an optionally substituted 3- to 8-membered ring, each of R<sup>8</sup> and R<sup>9</sup> is a hydrogen atom or optionally substituted hydrocarbon group, X is a bond, oxygen atom, optionally oxidized sulfur atom or optionally substituted nitrogen atom, Y is an optionally substituted methylene group or carbonyl group and n is 0 to 1), or a salt, prodrug or hydrate thereof, and discovered that such a compound has, on the basis of its specific chemical structure, an unexpectedly excellent phosphodiesterase (PDE) IV-inhibiting effect, and can be used as a prophylactic or therapeutic agent against an inflammation-induced disease, for example, bronchial asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, autoimmune disease, diabetes and the like. We made a further effort based on these findings, and finally established the present invention.

Scheme 1

[0144] Compound (IV') can be produced by reacting Compound (II') and Compound (III') wherein R<sup>16</sup> and R<sup>17</sup> are optionally substituted hydrocarbon groups which form a part of R<sup>7</sup>, and may be those similar to R<sup>7</sup>, and when R<sup>16</sup> forms a homocyclic ring with R<sup>6</sup> then it may have a substituent similar to a substituent which may be possessed by a "3- to 8-membered homocyclic ring" and W is a leaving group, if desired in the presence of a base.

[0145] Said "leaving group" may for example be a hydroxy, halogen atom (for example, fluorine, chlorine, bromine, iodine, etc.), optionally halogenated C<sub>1-5</sub> alkylsulfonyloxy (for example, methanesulfonyloxy, ethanesulfonyloxy, trichloromethanesulfonyloxy, etc.), optionally substituted C<sub>6-10</sub> arylsulfonyloxy and the like. An "optionally substituted C<sub>6-10</sub> arylsulfonyloxy" may for example, a C<sub>6-10</sub> arylsulfonyloxy (e.g., phenylsulfonyloxy, naphthylsulfonyloxy, etc.) which may have 1 to 3 substituent(s) selected from a C<sub>1-6</sub> alkyl (e.g. methyl, ethyl, etc.), C<sub>1-6</sub> alkoxy (e.g., methoxy, ethoxy, etc.) and nitro, and those exemplified typically are phenylsulfonyloxy, m-nitrophenylsulfonyloxy, p-toluenesulfonyloxy and the like.

[0146] The amount of Compound (III') employed is about 1 to about 5 moles, preferably about 1 to about 2 moles per mole of Compound (II').

[0147] Said "base" may for example be an inorganic base, basic salt, aromatic amine, tertiary amine, metal hydride, metal amide and metal alkoxide, etc. The amount of a base employed is about 1 to about 5 moles, preferably about 1 to about 2 moles per mole of Compound (II').

[0148] This reaction is conducted advantageously using a solvent which is inert to the reaction. While such a solvent is not limited particularly as long as the reaction is proceeded, it may for example be a solvent such as an alcohol, ether, hydrocarbon, amide, halogenated hydrocarbon, nitrile, ketone and sulfoxide as well as a mixture thereof.

[0149] The reaction time is usually about 30 minutes to about 48 hours, preferably about 1 hour to about 24 hours. The reaction temperature is usually about -20 to about 150 °C, preferably about 0 to about 100 °C.

[0150] In addition to the reaction described above, Mitsunobu reaction (Synthesis, 1981, p1-27) can also be employed.

[0151] Said reaction allows Compound (II') and Compound (III') wherein W is OH to react with each other in the presence of an azodicarboxylate (e.g., diethylazodicarboxylate, etc.) and a phosphine (e.g., triphenylphosphine, tributylphosphine, etc.).

[0152] The amount of Compound (III') wherein W is OH is about 1 to about 5 moles, preferably about 1 to about 2 moles per mole of Compound (II').

[0153] The amount of each of said "azodicarboxylate" and "phosphine" employed is about 1 to about 5 moles, preferably about 1 to about 2 moles per mole of Compound (II').

[0154] This reaction is conducted advantageously using a solvent which is inert to the reaction. While such a solvent is not limited particularly as long as the reaction is proceeded, it may for example be a solvent such as an ether, hydrocarbon, amide, halogenated hydrocarbon, nitrile, ketone and sulfoxide as well as a mixture thereof.

[0155] The reaction time is usually about 5 minutes to about 48 hours, preferably about 10 minutes to about 24 hours. The reaction temperature is usually about -20 to about 200 °C, preferably about 0 to about 100 °C.

[0156] Compound (V') is produced by subjecting Compound (IV') to a Claisen rearrangement.

[0157] This reaction is conducted advantageously without using a solvent or with using a solvent which is inert to the reaction. [0438] When an objective product is obtained in a free form by a reaction described above, then it may be converted in accordance with an ordinary method into a salt, and when it is obtained as a salt then it may be converted in accordance with an ordinary method into a free form or another salt. Compound (A), (I), (I'), (A-1), (I-1) or (I'-1) thus obtained can be isolated and purified from a reaction solution by a known method such as a partition, concentration, solvent extraction, fraction distillation, crystallization, recrystallization, chromatography and the like.

[0439] When Compound (A), (I), (I'), (A-1), (I-1) or (I'-1) is present as a configuration isomer, diastereomer, conformer and the like, then it can be isolated if desired by a separation or purification procedure described above. When Compound (A), (I), (I'), (A-1), (I-1) or (I'-1) is present as a racemate, it can be resolved into S form and R form by an ordinary optical resolution method.

[0440] When Compound (A), (I), (I'), (A-1), (I-1) or (I'-1) has its stereoisomers, then individual isomers or a mixture thereof may also encompassed in the invention.

[0454] A prodrug for an inventive Compound (I), (I'), (I-1) or (I'-1) is a compound which is converted into Compound (I), (I'), (I-1) or (I'-1) under a physiological condition as a result of a reaction with an enzyme or gastric acid, thus a compound undergoing an enzymatic oxidation, reduction or hydrolysis to form Compound (I), (I'), (I-1) or (I'-1) and a compound hydrolyzed by gastric acid to form Compound (I), (I'), (I-1) or (I'-1). A prodrug for Compound (I), (I'), (I-1) or (I'-1) may for example be a compound obtained by subjecting an amino group in Compound (I), (I'), (I-1) or (I'-1) to an acylation, alkylation or phosphorylation (e.g., a compound obtained by subjecting an amino group in Compound (I), (I'), (I-1) or (I'-1) to an eicosanoylation, alanylation, pentylaminocarbonylation, (5-methyl-2-oxo-1,3-dioxolen-4-yl)methoxycarbonylation, tetrahydrofuranylation, pyrrolidylmethylation, pivaloyloxymethylation and tert-butylation, etc.); a compound obtained by subjecting a hydroxy group in Compound (I), (I'), (I-1) or (I'-1) to an acylation, alkylation, phosphorylation or boration (e.g., a compound obtained by subjecting an hydroxy in Compound (I), (I'), (I-1) or (I'-1) to an acetylation, palmitoylation, propanoylation, pivaloylation, succinylation, fumarylation, alanylation, dimethylaminomethylcarbonylation, etc.); a compound obtained by subjecting a carboxy group in Compound (I), (I'), (I-1) or (I'-1) to an esterification or amidation (e.g., a compound obtained by subjecting a carboxy group in Compound (I), (I'), (I-1) or (I'-1) to an ethylesterification, phenylesterification, carboxymethylesterification, dimethylaminomethylesterification, pivaloyloxymethylesterification, ethoxycarbonyloxyethylesterification, phthalidylesterification, (5-methyl-2-oxo-1,3-dioxo-

len-4-yl)methylesterification, cyclohexyloxycarbonylethylesterification and methylamidation, etc.) and the like. Any of these compounds can be produced from Compound (I), (I'), (I-1) or (I'-1) by a method known per se.

[0455] A prodrug for Compound (I), (I'), (I-1) or (I'-1) may also be one which is converted into Compound (I), (I'), (I-1) or (I'-1) under a physiological condition, such as those described in "IYAKUHIN no KAIHATSU (Development of Pharmaceuticals)", Vol.7, Design of Molecules, p.163-198, Published by HIROKAWA SHOTEN (1990).

[0456] As a salt of Compound (A), (I), (I'), (A-1), (I-1), (I'-1), (B) or (C) may for example be a physiologically acceptable salt. For example, a salt with an inorganic base, ammonium, organic base, inorganic acid, organic acid, basic or acidic amino acid may be employed. A salt with an inorganic base may for example be an alkaline metal salt such as sodium and potassium salts, etc., an alkaline earth metal salt such as calcium and magnesium salts, etc., aluminum and the like. A salt with an organic base may for example be a salt with trimethylamine, triethylamine, pyridine, picoline, 2,6-lutidine, ethanolamine, diethanolamine, triethanolamine, cyclohexylamine, dicyclohexylamine or N,N'-dibenzylethylenediamine, etc. A salt with an inorganic acid may for example be a salt with hydrochloric acid, hydrobromic acid, nitric acid, sulfuric acid or phosphoric acid, etc. A salt with an organic salt may for example be a salt with formic acid, acetic acid, trifluoroacetic acid, phthalic acid, fumaric acid, oxalic acid, tartaric acid, maleic acid, citric acid, succinic acid, malic acid, methanesulfonic acid, benzenesulfonic acid or p-toluenesulfonic acid, etc. A salt with a basic amino acid may for example be a salt with arginine, lysine or ornithine, etc., and a salt with acidic amino acid may for example be a salt with aspartic acid or glutamic acid, etc.

[0457] Among those listed above, a pharmacologically acceptable salt is preferred, including, a salt with an inorganic acid such as hydrochloric acid, hydrobromic acid, nitric acid, sulfuric acid and phosphoric acid, etc., a salt with an organic acid such as acetic acid, phthalic acid, fumaric acid, oxalic acid, tartaric acid, maleic acid, citric acid, methanesulfonic acid and p-toluenesulfonic acid, etc. when Compound (I) or (I') has a basic functional group, as well as an alkaline metal salt such as sodium salt and potassium salt, etc., an alkaline earth metal salt such as calcium salt and magnesium salt, etc., and an ammonium salt when Compound (I) or (I') has a acidic functional group.

[0458] Since Compound (A), (I), (I'), (A-1), (I-1), (I'-1) according to the invention or a salt thereof (including a prodrug for Compound (I), (I-1), (I'), (I'-1)) (hereinafter abbreviated as an inventive compound) has an excellent phosphodiesterase (PDE) IV-inhibiting effect and a low toxicity and also is safe, it can be employed as a prophylactic or therapeutic agent in mammals (for example, human, mouse, dog, rat, cattle, etc.) against inflammatory diseases, for example, bronchial asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, autoimmune disease, diabetes, graft versus host disease, multiple sclerosis, sepsis, psoriasis, osteoporosis, depression, central dysfunction after cerebrovascular occlusion, cerebrovascular dementia, Alzheimer dementia, obesity, cardiac insufficiency, atopic dermatitis and the like, as well as a phosphodiesterase (PDE) IV inhibitor. The administration route may be oral or parenteral.

[0459] A specific dosage form may for example be a tablet (including sugar-coated and film-coated tablets), pill, capsule (including microcapsule), granule, fine powder, powder, syrup, emulsion, injection formulation, inhalation formulation, ointment, eye drop, aerosol, ophthalmic ointment, hard ointment, suppository, troche, poultic, liniment and the like. Any of these formulations can be prepared in accordance with an ordinary method (for example a method described in Japanese Pharmacopoeia).

[0460] The amount of an inventive compound in a formulation according to the invention may vary depending on the dosage form, and it is usually 0.01 to 100% by weight based on the entire formulation, preferably 0.1 to 50% by weight, more preferably 0.5 to 20% by weight.

[0461] Specifically, a tablet is produced by mixing a medicament as it is with an excipient, binder, disintegrant or other suitable additives to form a homogenous mass, granulating by a suitable method, combining with a lubricant and the like, and then compressing into a tablet, or by mixing a medicament as it is with an excipient, binder, disintegrant or other suitable additives to form a homogenous mass and then compressing directly into a tablet, or by preparing a granule first and then compressing into a tablet directly or after mixing with suitable additives to form a homogenous mass. The formulation can further contain colorants, seasonings and the like, if necessary. The formulation can further be film-coated by a suitable coating.

[0462] In a method for producing an injection formulation, a certain amount of a medicament is dissolved, suspended or emulsified in a water for injection, physiological saline and Ringer's solution when the medicament is water-soluble, or usually in a vegetable oil when the medicament is water-insoluble, whereby obtaining a certain quantity, or a certain amount of the medicament is enclosed in a vial for an injection formulation.

[0463] An oral formulation carrier is a material employed customarily in the pharmaceutical field, such as starch, mannitol, crystalline cellulose, sodium carboxymethylcellulose and the like. A vehicle for injection may for example be distilled water, physiological saline, glucose solution, infusion solution and the like. Other additives generally employed in a formulation may also be added properly.

[0464] While the dose of such a formulation may vary depending on the age, body weight, condition, administration route, administration frequency and the like, a daily dose in an adult having asthma is usually 0.01 to 100 mg/kg as an active ingredient (inventive compound), preferably 0.01 to 50 mg/kg, more preferably 0.05 to 10 mg/kg, which is given orally once or in two portions a day.

[0465] While the compound of the invention can exhibit an excellent phosphodiesterase (PDE) IV-inhibiting activity even when being given alone, it can be used also in combination (multimediment combination) with pharmaceutical components other than inventive compounds (hereinafter referred to as concomitant medicaments).

[0466] Such a concomitant medicament may for example be an antiasthma agent (for example, fluticasone propionate, beclomethasone propionate, theophylline, procaterol, ketotifen, azelastine, seratrodist, etc.), anti-allergic agent (for example, fexofenadine, epinastine, ebastine, etc.), anticholinergic agent (for example ipratropium bromide, flutropium bromide, oxitropium bromide, etc.), anti-inflammatory agent (for example, diclofenac sodium, ibuprofen, indomethacin, loxoprofen sodium, etc.), antibacterial agent (for example, cefixime, cefdinir, ofloxacin, tosufloxacin tosylate, levofloxacin, etc.), antifungal agent (for example, fluconazole, itraconazole, etc.), diabetes-treating agent (for example, pioglitazone, nateglinide, voglibose, acarbose, etc.), etc.

[0467] When using an inventive compound in combination with a concomitant medicament, the timings of the administration of the inventive compound and the concomitant medicament are not particularly limited; and the inventive compound and the concomitant medicament can be given to a subject simultaneously or at a certain time interval. The dose of the concomitant medicament may be in accordance with a dose employed clinically, and selected appropriately depending on the target, route, disease, combination and the like.

[0468] The administration mode of an inventive compound and a concomitant medicament are not particularly limited, provided that the inventive compound and the concomitant medicament are combined upon administration. Such an administration mode may for example be (1) an administration of a single formulation obtained by formulating an inventive compound and a concomitant medicament simultaneously, (2) a simultaneous administration via an identical route of two formulations obtained by formulating an inventive compound and a concomitant medicament separately, (3) a sequential and intermittent administration via an identical route of two formulations obtained by formulating an inventive compound and a concomitant medicament separately, (4) a simultaneous administration via different routes of two formulations obtained by formulating an inventive compound and a concomitant medicament separately, (5) a sequential and intermittent administration via different routes of two formulations obtained by formulating an inventive compound and a concomitant medicament separately (for example, inventive compound followed by concomitant medicament, or inverse order) and the like. These administration modes are hereinafter referred to as an inventive concomitant preparation.

[0469] An inventive concomitant preparation has a low toxicity, and thus an inventive compound and/or a concomitant medicament described above are mixed with a pharmacologically acceptable carrier in accordance with a method known per se to form a pharmaceutical composition, for example, a tablet (including sugar-coated and film-coated tablets), powder, granule, capsule (including softcapsule), solution, injection formulation, suppository, sustained release formulation and the like, which can safely be given orally or parenterally (e.g., topically, rectally, intravenously). An injection formulation may be given intravenously, intramuscularly, subcutaneously, into an organ, intranasally, intradermally, via eye drop, intracerebrally, rectally, vaginally and intraperitoneally, or into a tumor, or proximal to the tumor, or directly into a lesion.

[0470] A pharmacologically acceptable carrier which may be employed for producing an inventive concomitant preparation may for example be one similar to those employed in an inventive pharmaceutical composition described above.

[0471] The ratio between an inventive compound and a concomitant medicament in an inventive concomitant preparation may be selected appropriately on the basis of the target, route and disease, etc.

[0472] For example, the amount of an inventive compound contained in an inventive concomitant preparation is usually about 0.01 to 100% by weight based on the entire formulation, preferably about 0.1 to about 50% by weight, more preferably about 0.5 to about 20% by weight, although it may vary depending on the dosage form.

[0473] The amount of a concomitant medicament contained in an inventive concomitant preparation is usually about 0.01 to 100% by weight based on the entire formulation, preferably about 0.1 to about 50% by weight, more preferably about 0.5 to about 20% by weight, although it may vary depending on the dosage form.

[0474] The amount of an additive such as a carrier contained in an inventive concomitant preparation is usually about 1 to about 99.99% by weight based on the entire formulation, preferably about 10 to about 90% by weight, although it may vary depending on the dosage form.

[0475] Similar amounts may be employed also when an inventive compound and a concomitant medicament are formulated separately.

[0476] Such a formulation can be produced by a method known per se which is employed usually in a pharmaceutical process.

[0477] For example, an inventive compound and a concomitant medicament can be formulated with a dispersant (e.g., Tween 80 (ATLAS POWDER, USA), HC060 (NIKKO CHEMICALS), polyethylene glycol, carboxymethyl cellulose, sodium alginate, hydroxypropylmethyl cellulose, dextrin, etc.), a stabilizer (e.g., ascorbic acid, sodium pyrosulfite, etc.), a surfactant (e.g., polysorbate 80, macrogol, etc.), a solubilizing agent (e.g., glycerin, ethanol, etc.), buffer agent (e.g., phosphoric acid and its alkali metal salts, citric acid and its alkali metal salt, etc.), an osmotic agent (e.g., sodium chloride, potassium chloride, mannitol, sorbitol, glucose, etc.), a pH modifier (e.g., hydrochloric acid, sodium hydroxide,

etc.), a preservative (e.g., ethyl p-hydroxybenzoate, benzoic acid, methylparabene, propylparabene, benzyl alcohol, etc.), a solubilizer (e.g., concentrated glycerin, meglumine, etc.), a solubilizing aid (e.g., propylene glycol, sugar, etc.), a painkiller (e.g., glucose, benzyl alcohol, etc.), etc. into an aqueous formulation for injection, or dissolved, suspended or emulsified in a vegetable oil such as olive oil, sesame oil, cottonseed oil and corn oil, etc. and in a solubilizing aid such as propylene glycol, etc. to form an oily formulation, whereby producing an injection formulation.

[0478] In order to obtain an oral dosage form, a method known per se is employed to compress an inventive compound or a concomitant medicament for example with an excipient (e.g., lactose, sugar, starch, etc.), a disintegrant (e.g., starch, calcium carbonate, etc.), a binder (e.g., starch, gum arabic, carboxymethyl cellulose, polyvinyl pyrrolidone, hydroxypropyl cellulose, etc.) or a glidant (e.g., talc, magnesium stearate, polyethylene glycol 6000, etc.) into a desired shape, which is then subjected to a taste masking, covered with an enteric coating or imparted with a sustained release performance if necessary by means of a coating method known per se, whereby obtaining an oral dosage form. Such a coating may for example be hydroxypropylmethyl cellulose, ethyl cellulose, hydroxymethyl cellulose, hydroxypropyl cellulose, polyoxyethylene glycol, Tween 80, Pluronic F68, cellulose acetate phthalate, hydroxypropylmethyl cellulose phthalate, hydroxymethyl cellulose acetate succinate, Eudragit (Rohm, German, methacrylic/acrylic acid copolymer) and a colorant (e.g., iron oxide red, titanium dioxide, etc.). An oral dosage form may be an instantaneous release formulation or a sustained release formulation.

[0479] In order to obtain for example a suppository, a method known per se is employed to convert an inventive compound or concomitant medicament into an oily or aqueous solid, semi-solid or liquid suppository. The oily base employed in a composition described above may for example be a higher fatty acid glyceride [e.g., cocoa butter, UITEP-SOL (DYNAMITE NOVEL, Germany), etc.], a medium fatty acid [e.g., MIGRIOL (DYNAMITE NOVEL, Germany), etc.], or a vegetable oil (e.g., sesame oil, soybean oil, cottonseed oil, etc.), etc. The aqueous base may for example be polyethylene glycol and propylene glycol, and the aqueous gel base may for example be natural gums, cellulose derivatives, vinyl polymers and acrylic acid polymers, etc.

[0480] A sustained release formulation described above may for example be a sustained-release microcapsule, etc.

[0481] While a sustained-release microcapsule can be obtained by a method known per se, a sustained release formulation shown in Section [2] described below is formed and administered in a preferred case.

[0482] The inventive compound is preferably formulated as an oral dosage form such as a solid formulation (e.g., powder, granule, tablet, capsule, etc.), or as a rectal formulation such as a suppository, etc. The oral dosage form is particularly preferred.

[0483] A concomitant medicament can be formulated into a dosage form described above based on the type of the medicament.

[0484] The followings are the descriptions with regard to [1] the injection formulation of the inventive compound and the concomitant medicament and the method for producing the same, [2] the sustained-release or immediate release formulation of the medicament of the inventive compound and the concomitant medicament and the method for producing the same and [3] the sublingual, buccal or instant oral disintegration formulations employing of the inventive compound and the concomitant medicament and the method for producing the same.

#### [1] Injection formulation and method for producing the same

[0485] The solution obtained by dissolving the inventive compound and the concomitant medicament in water is employed preferably. Such injection formulation may contain a benzoate and/or a salicylate.

[0486] Said injection formulation is obtained by dissolving the inventive compound and the concomitant medicament in water together with a benzoate and/or a salicylate in water as desired.

[0487] The benzoate and/or a salicylate described above may be an alkali metal salt such as sodium and potassium salts, etc., an alkaline earth metal salt such as calcium and magnesium salts, etc., an ammonium salt, a meglumine salt as well as a salt of an organic acid such as trometamol, etc.

[0488] The concentration of an inventive compound or a concomitant medicament in an injection formulation is about 0.5 to about 50w/v%, preferably about 3 to about 20w/v%. The concentration of a benzoate and/or a salicylate is about 0.5 to about 50w/v%, preferably about 3 to about 20w/v%.

[0489] The formulation may contain additives employed customarily in a injection formulation, such as a stabilizer (ascorbic acid, sodium pyrosulfite and the like), a surfactant (polysorbate 80, macrogol and the like), a solubilizing agent (glycerin, ethanol and the like), a buffer agent (phosphoric acid and its alkali metal salt, citric acid and its alkali metal salt and the like), an osmotic agent (sodium chloride, potassium chloride and the like), a dispersing agent (hydroxypropylmethyl cellulose, dextrin), a pH modifier (hydrochloric acid, sodium hydroxide and the like), a preservative (ethyl p-hydroxybenzoate, benzoic acid and the like), a solubilizer (concentrated glycerin, meglumine and the like), a solubilizing aid (propylene glycol, sugar and the like), a painkiller (glucose, benzyl alcohol and the like) properly. Any of these additives are added in an amount employed customarily in a formulation for injection.

[0490] The pH of the injection formulation is adjusted at 2 to 12, preferably 2.5 to 8.0 with a pH modifier.

[0491] An injection formulation is obtained by dissolving an inventive compound and a concomitant medicament if desired together with a benzoate and/or salicylate in water if desired together with the additives listed above. These components may be dissolved in any order as appropriate similarly to a customary preparation of a formulation for injection.

[0492] An injection formulation is preferably warmed, and given as a formulation for injection after sterilizing by filtration or autoclave similarly to a customary formulation for injection.

[0493] An injection formulation is preferably autoclaved at 100 to 121 °C for 5 to 30 minutes.

[0494] A formulation may be present as a solution imparted with an antibacterial activity for the purpose of using several times in divided doses.

[2] Sustained-release or immediate release formulation and method for producing the same

[0495] A sustained release formulation obtained by coating a core containing an inventive compound or a concomitant medicament with a water-insoluble material or a swelling polymer as desired is employed preferably. For example, a sustained-release oral formulation of a single daily dose is preferred.

[0496] A water-insoluble material employed as a coating may for example be cellulose ether such as ethyl cellulose and butyl cellulose, etc., cellulose ester such as cellulose acetate and cellulose propionate, etc., polyvinyl ester such as polyvinyl acetate and polyvinyl butyrate, etc., acrylic acid-based polymer such as acrylic acid/methacrylic acid copolymer, methyl methacrylate copolymer, ethoxyethyl methacrylate/cinnamoethyl methacrylate/aminoalkyl methacrylate copolymer, polyacrylic acid, polymethacrylic acid, methacrylic acid alkylamide copolymer, poly(methyl methacrylate), polymethacrylate, polymethacrylamide, aminoalkyl methacrylate copolymer, poly(methacrylic anhydride), glycidyl methacrylate copolymer, especially, a series of Eudragit such as Eudragit RS-100, RL-100, RS-30D, RL-30D, RL-PO, RS-PO (ethyl acrylate/methyl methacrylate/chlorotrimethyl methacrylate/ethyl ammonium copolymer) and Eudragit NE-30D (methyl methacrylate/ethyl acrylate copolymer), hydrogenated oils such as a hydrogenated castor oil (e.g., Lubri wax (Freund Industrial Co., Ltd.)), waxes such as carnauba wax, a fatty acid glycerin ester and paraffin and a polyglycerin fatty acid ester, etc.

[0497] As a swelling polymer, a polymer having an acidic cleavable group and exhibiting a pH-dependent swelling is preferred, and an acidic cleavable group-bearing polymer which undergoes a less swelling at an acidic pH such as in stomach but is swollen extensively at a neutral pH such as in small and large intestines is preferred.

[0498] Such polymer having an acidic cleavable group and exhibiting a pH-dependent swelling may for example be a crosslinked polyacrylic acid polymer such as Carbomers 934P, 940, 941, 974P, 980, 1342 and the like, Polycarbophil and Calcium Polycarbophil (BF GOODRICH), HIGHVIS Wakos 103, 104, 105 and 304 (Wako Pure Chemical).

[0499] A coating employed in a sustained release formulation may further contain a hydrophilic material.

[0500] Such hydrophilic material may for example be a polysaccharide which may have a sulfate group such as pullulan, dextrin and alkali metal alginates, a polysaccharide having a hydroxyalkyl group or a carboxyalkyl group such as hydroxypropyl cellulose, hydroxypropylmethyl cellulose and sodium carboxymethyl cellulose as well as methyl cellulose, polyvinyl pyrrolidone, polyvinyl alcohol and polyethylene glycol, etc.

[0501] The water-insoluble material content in a coating of a sustained release formulation is about 30 to about 90% (w/w), preferably about 35 to about 80% (w/w), more preferably about 40 to about 75% (w/w), and the swelling polymer content is about 3 to about 30% (w/w), preferably about 3 to about 15% (w/w). A coating may further contain a hydrophilic material, the content of which in the coating is about 50% (w/w) or less, preferably about 5 to about 40% (w/w), more preferably about 5 to about 35% (w/w). Percent (w/w) referred here means a % by weight based on the coating composition which is the rest of the coating solution after deleting any solvent (e.g., water and a lower alcohol such as methanol and ethanol, etc.).

[0502] A sustained release formulation is produced, as exemplified below, by preparing a core containing a medicament followed by coating a resultant core with a coating solution obtained by melting a water-insoluble material or a swelling polymer or by dissolving or dispersing such material in a solvent.

#### I. Drug-containing core preparation

[0503] While a coated medicament-containing core (hereinafter sometimes referred to simply as a core) may be in any nonlimiting shape, it is formed preferably as a particle such as a granule or a fine particle.

[0504] When a core is a granule or a fine particle, it has a mean particle size preferable of about 150 to 2,000  $\mu\text{m}$ , more preferably about 500 to 1,400  $\mu\text{m}$ .

[0505] The core can be prepared by a standard method. For example, a medicament is combined with suitable excipient, binder, disintegrant, glidant, stabilizer and the like, and then subjected to a wet extrusion granulation or a fluidized bed granulation.

[0506] The medicament content in a core is about 0.5 to about 95% (w/w), preferably about 5.0 to about 80% (w/w),

more preferably about 30 to about 70% (w/w).

[0507] The excipient contained in a core may for example be a saccharide such as sucrose, lactose, mannitol and glucose, etc., starch, crystalline cellulose, calcium phosphate and corn starch. Among these, crystalline cellulose and corn starch are preferred.

[0508] A binder may for example be polyvinyl alcohol, hydroxypropyl cellulose, polyethylene glycol, polyvinyl pyrrolidone, Pluronic F68, gum arabic, gelatin and starch, etc. A disintegrant may for example be calcium carboxymethyl cellulose (ECG505), sodium croscarmellose (Ac-Di-Sol), crosslinked polyvinyl pyrrolidone (crospovidone) and a low-substituted hydroxypropyl cellulose (L-HPS), etc. Among these, hydroxypropyl cellulose, polyvinyl pyrrolidone and a low-substituted hydroxypropyl cellulose are preferred. A glidant and an anticoagulant may for example be talc, magnesium stearate, etc., and a lubricant may for example be polyethylene glycol, etc. A stabilizer may for example be an acid such as tartaric acid, citric acid, succinic acid, fumaric acid and maleic acid, etc.

[0509] In addition to the methods described above, other methods can be employed to form a core, such as an agitating granulation method wherein an inert carrier particle as a seed for the core is sprayed with a binder dissolved in a suitable solvent such as water and a lower alcohol (e.g., methanol and ethanol) with being supplemented portionwise with a medicament or a mixture thereof with an excipient and a glidant as well as a pan coating method, a fluidized bed coating method and a melting granulation method. An inert carrier particle may for example be one prepared from sugar, lactose, starch, crystalline cellulose and waxes, and has a mean particle size preferably of about 100  $\mu\text{m}$  to about 1,500  $\mu\text{m}$ .

[0510] In order to separate a medicament contained in a core from a coating, the surface of the core may be covered with a protective material. Such protective material may for example be a hydrophilic material described above and a water-insoluble material. A preferred protective material is polyethylene glycol or a polysaccharide having a hydroxyalkyl group or a carboxyalkyl group, more preferably, hydroxypropylmethyl cellulose and hydroxypropyl cellulose. The protective material may contain, as a stabilizer, an acid such as tartaric acid, citric acid, succinic acid, fumaric acid and maleic acid, as well as a glidant such as talc, etc. A protective material, when employed, is coated at a rate of about 1 to about 15% (w/w), preferably about 1 to about 10% (w/w), more preferably about 2 to about 8% (w/w) based on a core.

[0511] A protective material can be coated by a standard coating method, and typically a core is sprayed with the protective material by a fluidized bed coating method and a pan coating method.

## II. Coating of core with coating agent

[0512] A core obtained as described above in Section I is coated with a coating solution containing a water-insoluble material, a pH-dependent swelling polymer and a hydrophilic material being melted therein by heating or being dissolved or dispersed in a solvent to obtain a sustained release formulation.

[0513] A method for coating a core with a coating solution may for example be a spray coating.

[0514] The ratio between a water-insoluble material, a swelling polymer and a hydrophilic material in a coating solution may be selected appropriately in such a manner that respective contents in the coating become those specified above.

[0515] The coating rate is about 1 to about 90% (w/w) based on the core (excluding the protective material coating), preferably about 5 to about 50% (w/w), more preferably about 5 to about 35% (w/w).

[0516] The solvent for a coating solution is water or an organic solvent, which may be employed alone or in combination with each other. The ratio between water and the organic solvent when being employed in combination (water/organic solvent: weight ratio) may vary from 1 to 100%, and is preferably 1 to about 30%. While said organic solvent is not limited particularly as long as it can dissolve a water-insoluble material, it may for example be a lower alcohol such as methyl alcohol, ethyl alcohol, isopropyl alcohol and n-butyl alcohol, etc., a lower alkanone such as acetone, etc., as well as acetonitrile, chloroform, methylene chloride and the like. Among those listed above, a lower alcohol is preferred, with ethyl alcohol and isopropyl alcohol being especially preferred. Water and a mixture of water and an organic solvent are employed preferably as solvents for a coating. In such a case, an acid such as tartaric acid, citric acid, succinic acid, fumaric acid and maleic acid may be added to the coating solution for the purpose of stabilizing the coating solution.

[0517] An operation when the coating is effected by a spray coating, a standard coating method can be employed, and typically a core is sprayed with a coating by a fluidized bed coating method and a pan coating method. During this process, a lubricant such as talc, titanium oxide, magnesium stearate, calcium stearate and light silicic anhydride, etc. and a plasticizer such as glycerin fatty acid ester, hardened castor oil, triethyl citrate, cetyl alcohol and stearyl alcohol, etc. may also be added.

[0518] After coating with the coating agent, an antistatic agent such as a talc may also be incorporated if necessary.

[0519] An instantaneous release formulation may be a liquid (solution, suspension, emulsion, etc.) or a solid (particle, pill, tablet, etc.). While an oral formulation and a parenteral formulation such as an injection formulation may be em-

played, an oral formulation is preferred.

[0520] An instantaneous release formulation may usually contain, a carrier, additive and excipient (hereinafter sometimes abbreviated as excipient) which are employed customarily in the pharmaceutical field, in addition to a medicament which is an active ingredient. Such a formulation excipient is not limited particularly as long as it is an excipient employed usually as a formulation excipient. For example, an excipient for an oral solid formulation may be lactose, starch, corn starch, crystalline cellulose (Asahi Kasei, Avicel PH101 and the like), powder sugar, granulated sugar, mannitol, light silicic anhydride, magnesium carbonate, calcium carbonate, L-cysteine and the like, with corn starch and mannitol being preferred. Any of these excipients may be employed alone or in combination with each other. The amount of an excipient may for example be about 4.5 to about 99.4w/w%, preferably about 20 to about 98.5w/w%, more preferably about 30 to about 97w/w%, based on the entire amount of an instantaneous release formulation.

[0521] The medicament content in an instantaneous release formulation may be selected within the range from about 0.5 to about 95%, preferably about 1 to about 60%, based on the entire amount of an instantaneous release formulation.

[0522] An oral solid instantaneous release formulation contains a disintegrant in addition to the ingredients described above. Such a disintegrant may for example be calcium carboxymethyl cellulose (GOTOKUYAKUHIN, ECG505), sodium croscarmellose (for example, Asahi Kasei, Ac-Di-Sol), crospovidone (for example, BASF, COLIDON CL), low-substituted hydroxypropyl cellulose (SHINETSU KAGAKU), carboxymethyl starch (MATSUTANI KAGAKU), sodium carboxymethyl starch (KIMURASANGYO, EXORITAB), partial a starch (Asahi Kasei, PCS) and the like, any of which may for example be brought into contact with water to effect water absorption or swelling, or to make a channel between a core-forming active ingredient and an excipient, whereby disintegrating a granule. Any of these disintegrants may be employed alone or in combination with each other. While the amount of a disintegrant to be incorporated may be selected appropriately based on the type and the amount of the medicament employed and the preparation design for releasing, it may for example be about 0.05 to about 30w/w%, preferably about 0.5 to about 15w/w% based on the entire amount of an instantaneous release formulation.

[0523] An oral solid instantaneous release formulation contains additives employed customarily in a solid formulation if desired in addition to the components described above. Such additives may for example be binders (for example, sucrose, gelatin, powdery gum arabic, methyl cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose, carboxymethyl cellulose, polyvinylpyrrolidone, pulluran, dextrin, etc.), lubricants (polyethylene glycol, magnesium stearate, talc, light silicic anhydride (for example, aerosil (NIPPON AEROSIL)), surfactants (for example, anionic surfactants such as sodium alkylsulfate, nonionic surfactants such as polyoxyethylene fatty acid ester and polyoxyethylene sorbitan fatty acid ester, polyoxyethylene castor oil derivatives, etc.), colorants (for example, tar-based colorants, caramel, red ochre, titanium oxide, riboflavin, etc.), if necessary together with seasonings (for example, sweetener and flavor), adsorbents, preservatives, wetting agents, antistatic agents and the like. As a stabilizer, an organic acid such as tartaric acid, citric acid, succinic acid and fumaric acid may also be added.

[0524] Binders described above are preferably hydroxypropyl cellulose, polyethylene glycol and polyvinylpyrrolidone, etc.

[0525] An instantaneous formulation can be prepared based on an ordinary formulation technology by mixing the components described above and kneading if necessary and then molding. Such a mixing may be accomplished by an ordinary method, such as mixing and kneading. Typically, when an instantaneous release formulation is formed as a particle, then a method similar to that for preparing a core of a sustained release formulation described above is employed to mix the materials using a vertical granulator, multi-purpose kneader (HATAKE TEKKOSHO), fluidized bed granulator FD-5S (Powrex Corporation) and the like, after which a granulation is effected using a wet extrusion granulation or a fluidized bed granulation.

[0526] Each of an instantaneous release formulation and a sustained release formulation thus obtained may be formulated separately by a standard method as it is or in combination with an excipient properly and then provided as a final formulation for simultaneous administration or intermittent sequential administration, or the both may be formulated in a single oral formulation (e.g., granule, fine powder, tablet, capsule, etc.) as they are or in combination with an excipient properly. The both formulation may be formulated also as granules or fine powders, which are then filled in a single capsule for oral administration.

[3] Sublingual, buccal or instant oral disintegration formulations and method for producing the same

[0527] Any of sublingual, buccal or instant oral disintegration formulations may be a solid formulation such as a tablet, etc., or may be an oral mucosa plaster (film).

[0528] Each of sublingual, buccal or instant oral disintegration formulations is preferably a formulation containing an inventive compound or a concomitant medicament together with an excipient. An auxiliary agent may also be contained such as a lubricant, osmotic agent, hydrophilic carrier, water-dispersible polymer and stabilizer. For the purpose of promoting the absorption and enhancing the bioavailability,  $\beta$ -cyclodextrin or  $\beta$ -cyclodextrin derivatives (e.g., hydroxypropyl- $\beta$ -cyclodextrin, etc.), etc. may also be contained.

[0529] Such an excipient may for example be lactose, sugar, D-mannitol, starch, crystalline cellulose, light silicic anhydride and the like. A lubricant may for example be magnesium stearate, calcium stearate, talc, colloidal silica and the like, with magnesium stearate and colloidal silica being preferred. An osmotic agent may for example be sodium chloride, glucose, fructose, mannitol, sorbitol, lactose, saccharose, glycerin and urea, with mannitol being preferred especially. A hydrophilic carrier may for example be a swelling hydrophilic carrier such as a crystalline cellulose, ethyl cellulose, crosslinked polyvinyl pyrrolidone, light silicic anhydride, silicic acid, dicalcium phosphate, calcium carbonate and the like, with a crystalline cellulose (e.g., microcrystalline cellulose) being preferred. A water-dispersible polymer may for example be a gum (e.g., tragacanth gum, acacia gum, guar gum), alginate (e.g., sodium alginate), cellulose derivative (e.g., methyl cellulose, carboxymethyl cellulose, hydroxymethyl cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose), gelatin, water-soluble starch, polyacrylic acid (e.g., carbomer), polymethacrylic acid, polyvinyl alcohol, polyethylene glycol, polyvinylpyrrolidone, polycarbophil, ascorbate palmitate ester and the like, with hydroxypropylmethyl cellulose, polyacrylic acid, alginate, gelatin, carboxymethyl cellulose, polyvinylpyrrolidone and polyethylene glycol, etc. being preferred. Hydroxypropylmethyl cellulose is especially preferred. A stabilizer may for example be cysteine, thiosorbitol, tartaric acid, citric acid, sodium carbonate, ascorbic acid, glycine and sodium sulfite, with citric acid and ascorbic acid being preferred especially.

[0530] Each of sublingual, buccal or instant oral disintegration formulations can be produced by mixing an inventive compound or concomitant medicament with an excipient by a method known per se. If desired, an auxiliary agent described above, such as lubricant, osmotic agent, hydrophilic carrier, water-dispersible polymer, stabilizer, colorant, sweeteners and preservative, may also be incorporated. After mixing the components described above simultaneously or at a certain time interval, the mixture is compressed and molded into each of sublingual, buccal or instant oral disintegration formulations. For the purpose of obtaining a suitable hardness, a solvent such as water and alcohol may be employed to hydrate the mixture before or after the tablet impaction, and then dried finally.

[0531] When an oral mucosa plaster (film) is to be molded, an inventive compound or concomitant medicament and a water-dispersible polymer (preferably, hydroxypropyl cellulose, hydroxypropylmethyl cellulose) and excipient described above are dissolved in a solvent such as water, and then the resultant solution is casted into a film. Additives may also be added such as plasticizers, stabilizers, antioxidants, preservatives, colorants, buffering agents and sweeteners. A glycol such as polyethylene glycol or propylene glycol may be added for the purpose of imparting a film with an appropriate elasticity, and a bioadhesive polymer (e.g., polycarbophile, carbopol) may be added for the purpose of enhancing the adhesion of the film to the oral mucosal lining. The casting may be accomplished by pouring a solution onto a non-adhesive surface, spreading the solution using a coater such as a doctor blade, etc. into a uniform thickness (preferably about 10 to 1000 microns), and then drying the solution to form a film. The film thus formed is dried at room temperature or with warming, and then cut into pieces each having a desired surface area.

[0532] A preferred instant oral disintegration formulation may for example be a rapid diffusion formulation in the form of a solid network consisting of an inventive compound or concomitant medicament together with a water-soluble or water-diffusible carrier which is inert to the inventive compound or concomitant medicament. Said network is obtained by sublimating a solvent from a solid composition consisting of a solution of an inventive compound or concomitant medicament in a suitable solvent.

[0533] In addition to an inventive compound or concomitant medicament, a matrix-forming agent and a secondary component are contained preferably in the composition of said instant oral disintegration formulation.

[0534] Said matrix-forming agents may for example be an animal or vegetable protein such as a gelatin, dextrin and soybean, wheat and psyllium seed proteins; a gummy material such as gum arabic, guar gum, agar and xanthane gum; polysaccharide; alginate; carboxymethyl cellulose; carrageenan; dextran; pectin; synthetic polymer such as polyvinylpyrrolidone; a material derived from a gelatin-gum arabic complex. Those which are also included are saccharides such as mannitol, dextrose, lactose, galactose and trehalose, etc.; cyclic saccharides such as cyclodextrin, etc.; inorganic salts such as sodium phosphate, sodium chloride and aluminum silicate, etc.; amino acids having 2 to 12 carbon atoms such as glycine, L-alanine, L-aspartic acid, L-glutamic acid, L-hydroxyproline, L-isoleucine, L-leucine and L-phenylalanine, etc.

[0535] One or more matrix-forming agents may be introduced into a solution or suspension before solidification. Such a matrix-forming agent may be present in addition to a surfactant, or may be present in the absence of the surfactant. The matrix-forming agent serves not only to form a matrix itself, but also to aid in maintaining the inventive compound or concomitant medicament as being diffused in the solution or suspension.

[0536] A secondary agent may be contained in a composition such as a preservative, antioxidant, surfactant, thickening agent, colorant, pH modifier, flavor, sweetener or taste masking agent, etc. A suitable colorant may for example be iron oxide red, black and yellow, FD&C dyes available from ERIS AND EVERALD such as FD&C Blue No.2 and FD&C Red No.40. A suitable flavor may for example be mint, raspberry, licorice, orange, lemon, grape fruit, caramel, vanilla, cherry and grape flavor as well as a combination thereof. A suitable pH modifier may for example be citric acid, tartaric acid, phosphoric acid, hydrochloric acid and maleic acid. A suitable sweetener may for example be aspartame, acesulfame K and thaumatin. A suitable taste masking agent may for example be sodium bicarbonate, ion exchange

resin, cyclodextrin inclusion compound, adsorbent and microencapsulated apomorphine.

[0537] A formulation contains an inventive compound or concomitant medicament in an amount usually of about 0.1 to about 50% by weight, preferably about 0.1 to about 30% by weight, and is preferably a formulation (sublingual or buccal formulation described above) which allows 90% or more of the inventive compound or concomitant medicament to be dissolved (in water) within a time period of about 1 to about 60 minutes, preferably about 1 minutes to about 15 minutes, more preferably about 2 minutes to about 5 minutes, or a instant oral disintegration formulation which disintegrates within about 1 to about 60 seconds, preferably about 1 to about 30 seconds, more preferably about 1 to about 10 seconds after being placed in the oral cavity.

[0538] The amount of an excipient described above based on the entire formulation is about 10 to about 99% by weight, preferably about 30 to about 90% by weight. The amount of  $\beta$ -cyclodextrin or  $\beta$ -cyclodextrin derivative based on the entire formulation is about 0 to about 30% by weight. The amount of a lubricant based on the entire formulation is about 0.1 to about 10% by weight, preferably about 1 to about 5% by weight. The amount of an osmotic agent based on the entire formulation is about 0.01 to about 90% by weight, preferably about 10 to about 70% by weight. The amount of a hydrophilic carrier based on the entire formulation is about 0.1 to about 50% by weight, preferably about 10 to about 30% by weight. The amount of a water-dispersible polymer based on the entire formulation is about 0.1 to about 30% by weight, preferably about 10 to about 25% by weight. The amount of a stabilizer based on the entire formulation is about 0.1 to about 10% by weight, preferably about 1 to about 5% by weight. The formulation described above may further contain additives if desired such as colorants, sweeteners and preservatives, etc.

[0539] While the dose of an inventive concomitant preparation may vary depending on the type of the inventive compound, the subject's age, body weight, condition, and the dosage form as well as administration mode and duration, the daily dose for example in a patient having a breast cancer (adult, body weight: about 60 kg) is about 0.01 to about 1000 mg/kg as an inventive compound and concomitant medicament, preferably about 0.01 to about 100 mg/kg, more preferably about 0.1 to about 100 mg/kg, particularly about 0.1 to about 50 mg/kg, especially about 1.5 to about 30 mg/kg, which is given intravenously at once or in several portions. It is a matter of course that the dose may vary depending on various factors as described above, and a less amount may sometimes be sufficient and an excessive amount should sometimes be required.

[0540] A concomitant medicament may be employed in any amount within the range causing no problematic side effects. The daily dose of a concomitant medicament is not limited particularly and may vary depending on the severity of the disease, the subject's age, sex, body weight and susceptibility as well as time and interval of the administration and the characteristics, preparation, type and active ingredient of the pharmaceutical formulation, and the daily oral dose per kg body weight in a mammal is about 0.001 to 2000 mg, preferably about 0.01 to 500 mg, more preferably about 0.1 to about 100 mg as medicaments, which is given usually in 1 to 4 portions.

[0541] When the inventive concomitant preparation is administered, it may be administered at the same time, but it is also possible that the concomitant medicament is first administered and then the inventive compound is administered, or that the inventive compound is first administered and then the concomitant medicament is administered. When such an intermittent administration is employed, the time interval may vary depending on the active ingredient administered, the dosage form and the administration mode, and when the concomitant medicament is first administered, the inventive compound may be administered within 1 minute to 3 days, preferably 10 minutes to 1 day, more preferably 15 minutes to 1 hour after the administration of the concomitant medicament. When the inventive compound is first administered, then the concomitant medicament may be administered within 1 minutes to 1 day, preferably 10 minutes to 6 hours, more preferably 15 minutes to 1 hour after the administration of the inventive compound.

[0542] The present invention is further detailed in the following Reference Examples, Examples, Formulation Examples and Experiment Examples, any of which serves only a practice and is not intended to restrict the invention and can be modified without departing from the scope of the invention.

[0543] In the following Reference Examples and Examples, the term "room temperature" usually means a temperature from about 10 to about 35°C. ## Formulation Example 4

[1343] In a fluidized bed granulating drier (FD-5S, KK POWREX Corporation), 1500 g of the compound obtained in Example 1, 2025 g of lactose and 556.5 g of corn starch were mixed homogeneously, and then an aqueous solution in which 126 g of hydroxypropyl cellulose was dissolved was sprayed in the drier to effect a granulation, after which the mixture was dried in the fluidized bed granulating drier. ## Experiment Example 1 Assay of phosphodiesterase IV-inhibiting effect

## (1) Human brain-derived phosphodiesterase 4D3-encoding gene cloning

**[1349]** From a human brain cDNA library, a gene encoding phosphodiesterase 4D3 was cloned. Using 1 ng of brain QUICK-Clone™ cDNA (Clontech) as a template, each 20 pmol of a primer set: 5'-CCACGATAGCTGCTCAAACAA-GAG-3' (SEQ. ID. No.1) and 5'-ATAGAAACCCCAAGTCCAATAAAC-3' (SEQ. ID. No.2) which was prepared referring to the phosphodiesterase 4D3 gene base sequence reported by Nemoz et al (FEBS Letters 384, 97-102, 1996) was added to effect a PCR by a MiniCycler™ (MJ RESEARCH) using TaKaRa EX Taq (TAKARA) (reaction condition: 30 cycles of 0.5 minutes at 94°C, 0.5 minutes at 55°C and 4 minutes at 72°C). The resultant PCR product was subjected to an agarose gel electrophoresis and an about 2.4 kb DNA fragment was recovered. This fragment was made blunt using a Pfu DNA polymerase (STRATAGENE) and then a phosphodiesterase 4D3 gene was cloned using Zero Blunt PCR Cloning Kit (Invitrogen).

## (2) Construction of E.coli expression vector

**[1350]** The plasmid obtained in Section (1) described above was digested with a restriction enzyme EcoRI (Takara) and subjected to an agarose gel electrophoresis to recover an about 2.4 kb DNA fragment. This DNA fragment was digested with a restriction enzyme EcoRI (Takara) and ligated with a pGEX4T-3 (Pharmacia) which had been treated with BAP (Takara). The resultant cDNA fragment had the base sequence represented by Sequence ID No.3, and the amino acid sequence represented by Sequence ID No.4 was found to be encoded by the 74th to the 2092nd bases of this base sequence. This cDNA fragment was transformed into an E.coli BL21 (FUNAKOSHI) using a ligation solution, whereby obtaining an Escherichia coli BL21/pPDE4D3 capable of expressing the phosphodiesterase 4D3 gene.

## (3) Expression of recombinant human brain-derived phosphodiesterase 4D3 in Escherichia coli and purification thereof

**[1351]** Using the Escherichia coli BL21/pPDE4D3 obtained in Section (2) described above, a recombinant human brain-derived phosphodiesterase 4D3 was obtained. The expression and purification of E. coli were in accordance with the protocol attached to GST Gene Fusion System (Pharmacia). As a result, 34 mg of an about 76 kDa recombinant human brain-derived phosphodiesterase 4D3 was obtained as a target substance from 1 L of the E. coli culture medium.

## (4) Assay of phosphodiesterase IV-inhibiting effect

**[1352]** To a 96-well plate (OPTI plate, Packard), 10 µl of a buffer solution [0.5 M Tris-HCl (pH7.5), 83 mM MgCl<sub>2</sub>, 17mM EGTA], 10 µl of the recombinant human brain-derived phosphodiesterase 4D3 (0.0034 mg/ mL) obtained in Section (1) described above, 65 µl of Ultrapure water, 5 µl of an inhibitor sample and 10 µl of [<sup>3</sup>H]cAMP were added and reacted for 30 minutes at 30°C. After completing the reaction, 50 µl of SPA beads solution [18 mg/ mL Yttrium silicate beads, 18mM ZnSO<sub>4</sub>] was added, allowed to stand at room temperature for about 20 minutes, and the radioactivity was counted using a scintillation counter (Topcount, Packard). The radioactivity observed in the presence of the recombinant human brain-derived phosphodiesterase 4D3 was 28245 cpm, which was in contrast with the control radioactivity (1020 cpm). This reaction underwent the inhibition of the phosphodiesterase activity in the presence of a phosphodiesterase IV inhibitor rolipram (BIOMOL Research Laboratories, Inc), and rolipram inhibited this enzymatic reaction by 50% at about 100 nM. This assay system was employed to determine the recombinant human brain-derived phosphodiesterase-inhibiting effect (IC<sub>50</sub>) of each inventive compound. The results are shown in Table 23.

Example 2 Inhibiting effect on antigen-induced bronchoconstriction in guinea pigs

## (1) Preparation of rabbit anti-ovalbumin (OA) serum

[1353] A white rabbit (body weight: about 3 kg; New Zealand white: KITAYAMA LABES) was immunized by an intramuscular administration of 1.0 mL of an emulsion of 0.5 mL of a 10% OA (Grädle III, Sigma) solution and 0.5 mL of Freund Complete Adjuvant (WAKO PURE CHEMICAL INDUSTRIES, LTD.). This procedure was conducted once every week repetitively 4 times in total. One week after the final immunization, the whole blood was sampled. The blood sample was allowed to stand at room temperature for 1 hour or longer, and then in a refrigeration room for a day. On the following day, the serum fraction was isolated and centrifuged (3000 rpm, 10 min.), and the supernatant was stored as an antiserum at -20°C.

## (2) Antigen-induced bronchoconstriction

[1354] The bronchoconstriction was measured by a modified Konzett-Rossler method. Each male Hartley guinea pig weighing 400 to 500 g (NIPPON SLC, Shizuoka) was anesthetized with ether, treated intravenously with 1.0 mL of a 8- to 16-fold diluted anti-OA serum, and subjected to an experiment after 16 to 24 hours. Under an anesthesia with urethane (1.2 g/kg ip) (Aldrich), a tracheal cannula was inserted, and gallamine triethiodide (1 mg/kg, iv) (Sigma) was administered to arrest the spontaneous respiration. The animal was ventilated artificially using an artificial respirator (Harvard model 683) at 70 respirations/minutes, with each ventilation volume of 2 to 3 mL and initial load of 10 cmH<sub>2</sub>O, and the intratracheal pressure was measured at the side arm of the tracheal cannula using a differential pressure type transducer. Mepyramine maleate (1.0 mg/kg) (Sigma) and propranolol (1.0 mg/kg) (Sigma) were administered intravenously 2 minutes after the administration of gallamine triethiodide, and after further 2 minutes the OA antigen (1.0 mg/kg) was administered intravenously to induce the bronchoconstriction.

[1355] A compound of Example was dissolved in 25% dimethylacetamide, 25% polyethylene glycol 400 and 50% physiological saline, and administered intravenously 5 minutes before the antigen challenge at a dose of 1 mg/kg. Percent inhibition was calculated based on the comparison with a control group (intravenous administration of a mixture of 25% dimethylacetamide, 25% polyethylene glycol 400 and 50% physiological saline). The % inhibition by each inventive compound is shown in Table 24.

## INDUSTRIAL APPLICABILITY

[1356] A furoisoquinoline derivative of the invention has an excellent phosphodiesterase (PDE) IV-inhibiting effect, and is useful as a prophylactic or therapeutic agent against an inflammation-induced disease, such as bronchial asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, autoimmune disease and diabetes, etc.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP01/02277

**Box I** Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 35-49  
because they relate to subject matter not required to be searched by this Authority, namely:  
The inventions as set forth in claims 35 to 49 involve methods for treatment of the human body by therapy.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II** Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

The invention as set forth in claim 34 relates to *Escherichia coli* expressing phosphodiesterase 4D3 gene. Since this bacterium is used for testing the pharmacological effect of the compound as set forth in claim 1, there is no special technical feature common to claims 34 and 1. Such being the case, claim 1 is not considered as complying with the requirement of unity of invention to the specified invention of claim 1.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
